Final Project Proposal

Smart Event Ticketing & QR Check-in System

Project Description:

The Smart Event Ticketing & QR Check-in System is a modern web application that enables event organizers to create, manage, and sell event tickets digitally.
It provides a seamless experience for customers to browse events, book tickets online, and securely check in using QR codes.

Group Members & Role:

- Omar Elsawy – Team Leader / Developer: Responsible for Back End (Dashboard and Check in)
- Ahmed Elafandy – Developer: Responsible for Front End (Ui and Database diagram and model)
- Ahmed Ebrahim – Developer: Responsible for Back End(Home and Event)
- Mahmoud Abdulkaream – Developer: Responsible for Back End(authentication and authorizations)
- Mohamed Hamed – Developer: Responsible for Back End(Dashboard and Check in)

All team members will collaborate throughout all project stages starting with the frontend design, then database implementation, and finally backend development using ASP.NET MVC

Team Leader:

- **Name:** Omar Elsawy
- **Role:** Team Leader
- **Developer Responsibilities:** Leading the team, organizing tasks, managing communication between members, and contributing to the development of the Parent Page and overall project integration.

Objectives:

Tools & Technologies:

- The project will be developed using the ASP.NET MVC framework with C# as the main programming language. For the frontend, the team will use HTML, CSS, and Java Script to ensure a responsive and user-friendly interface. The backend will be supported by Microsoft SQL Server for database management, and Visual Studio and Visual Studio Code will be used as the main development environments.

Milestones & Deadlines:

- **Week 1** – Requirement Analysis & Planning: Define the project scope, roles, and main functionalities.
- **Week 2** – UI/UX Design & Frontend Development: Design the main pages and build the initial interface using HTML, CSS, JavaScript, and Bootstrap.
- **Weeks 3–4** – Database Design & Backend Development: Create and connect the SQL Server database and

implement core functionalities using ASP.NET MVC and C#.

- **Week 5** – System Testing & Integration: Test all modules, fix issues, and ensure proper data flow between system components.
- **Week 6** – Final Review & Submission: Finalize the platform, prepare the project documentation, and deliver the final version for evaluation

KPIs (Key Performance Indicators):

System Functionality Completion Rate :

- Measures the percentage of system features successfully implemented compared to the total planned features.
  A higher rate indicates steady project progress and feature readiness.

Code Quality & Architecture Compliance Score:

- Evaluates how well the source code follows best practices, naming conventions, and the project's architectural structure (e.g., MVC).
  This ensures maintainability, scalability, and readability of the system.

Testing & Reliability Rate:

- Tracks how many tests (unit, integration, and system tests) pass successfully.
  A high rate shows that the system is stable and reliable under different conditions.

Performance & Efficiency Rate

- Measures how fast and efficiently the system performs underload including API response time, page load speed, and resource usage.
  Optimized performance ensures a smooth user experience.

Error or Defect Rate:

- Monitors the number of software bugs or defects identified during development or testing phases.
  A lower defect rate reflects better code stability and quality assurance.
